

Archelix Giphys – Project 2 Summary

Project Overview

This project is a front-end web application titled "**Archelix Giphys**". The site demonstrates API usage and responsive design by allowing users to search for dinosaur-related GIFs via the Giphy API.

The theme connects with the Archelix exhibit branding, blending ancient inspiration with modern interactivity from one of my old UTA school project layout.

Project Structure

The repository includes the following key components:

- **HTML File:** giphys.html (main interactive page)
- **CSS:** styles.css for page styling
- **JavaScript:** archelix.js (site-wide behavior) | giphys.js (Giphy API interaction)

Key Features

- Responsive layout for both mobile and desktop screens
- Dynamic search form that queries the Giphy API using user input
- Image grid that displays dinosaur GIFs returned from the API

Workflow Summary

- Planned layout and structure with responsive design in mind
- Created wireframe/flow for GIF display sections
- Connected to the Giphy API using JavaScript fetch() and async/await
- Used GitHub for version control with meaningful commit messages
